

# Important considerations for backtesting and optimization:

- 1. Never forget to use the correct GMT offset. In some cases, the broker may have changed its GMT offset at some point in the past, so be careful when running backtests longer than one year.
- 2. All presets were prepared using historical data from an AAAFx Live MT5 account.
- 3. Some configurations are too heavy to run in Every Tick mode. If you want faster backtests, it is recommended to use M1 OHLC modeling.

- 4. Leverage is very important for grid systems. Make sure your backtests use 1:500 leverage, the same configuration used in real AAAFx accounts
